

Bsmart Water Solutions

"Tap into a natural resource"

SCHOOL WATER GRANT SCHEME

The practice of using mains water to supply all our water needs is needlessly wasteful, both financially and environmentally. Mains water is expensively purified to drinking water standards - but much of the water is used for non-potable purposes, like flushing toilets and cleaning.

Did you know?

Every time a toilet is flushed it uses up to 13 litres of water.

Harvested rainwater can be substituted for mains water, saving money and contributing to the protection of a key natural resource. Approximately 100,000 litres of rainwater falls on your property every year and the average person uses 150 litres of water every day.

Irish Schools are being left without water every year due to bad weather and this leads to school closures.

€9.75 Million School Fund Available

The Government have made €9.75 Million available to schools to help them reduce their water usage and save money on water charges.
